

Dear American Century Investments team,

I'm applying for the Investment Management Software Engineer position in Kansas City. What caught my attention is the combination of hands-on Python development, AWS, data-intensive systems, and software architecture. I've spent my career building across those layers, often in systems where performance, reliability, and complex data processing all matter at once.

I'm a computer engineer and co-founder/CTO of Cambrian, where I've led technical architecture while remaining a hands-on engineer. I've built full-stack production software since 1999, across Python, Java, C#, C/C++, Rust, TypeScript, SQL, web and native systems, with extensive AWS and database experience.

At Cambrian, one example was a production Python/TensorFlow image-processing platform for our enterprise flooring products. Uploaded images moved through a multi-stage pipeline that extracted semantic structure, geometry, surface normals, lighting, camera parameters, and other representations used downstream for reconstruction and rendering. I built the surrounding APIs, data flow, S3 integration, Docker CPU/GPU deployment, testing and model infrastructure, and elastically scaling AWS inference systems.

My broader background includes relational data modeling and SQL, custom ORMs and backend services, message-driven and distributed systems, cloud infrastructure, APIs and SDKs, automated testing, and performance-sensitive systems. I've also spent years working directly with enterprise customers to understand requirements, evaluate technical approaches, explain tradeoffs, support integrations, and carry systems through production delivery.

More recently I've been building Continuum, a large distributed AI system in Rust, along with Python/PyTorch transformer research. Although those projects are AI-focused, much of the underlying engineering is familiar software architecture: scheduling, resource management, messaging, storage, telemetry, evaluation, distributed execution, and making complex systems observable and reliable.

I haven't worked professionally in investment management, so the investment domain itself would be new to me. What I bring is a long history of learning unfamiliar domains quickly and building the software underneath them, from financial and tax applications earlier in my career to computer vision, biometrics, cybersecurity, cloud ML, and distributed AI.

I'm based in the Kansas City area and would welcome the opportunity to bring that breadth and hands-on engineering experience to American Century Investments.
